Accessibility

To ensure that my website adheres to international accessibility guidelines, I reviewed the teachings from our class sessions and referred to the syllabus for more details on marking. I paid special attention to color accessibility, considering that the website features a color changer option. Additionally, I utilized the developer tools in my browser to conduct an accessibility check and identified any areas that needed improvement.

Upon running the accessibility check, I found that my website had some issues, primarily related to color contrast and an empty button error. Despite these challenges, I am committed to making the necessary adjustments to ensure that my website is accessible to all users.

I try to use the CRAP principal to maintain a professional manner in the code.
